

# Geometry segmentation based on the normal vector field with total variation regularization

Manuel Weiß<sup>1</sup> Prof. Dr. Roland Herzog<sup>2</sup> Dr. Stephan Schmidt<sup>3</sup> Lukas Baumgärtner<sup>4</sup>  
Prof. Dr. Ronny Bergmann<sup>5</sup>

The total variation has proven as a useful regularizer for various applications in Inverse imaging and Shape optimization problems. For the task of shape segmentation, we propose a model that incorporates the normal vector data of a discrete surface with a total variation penalty of the resulting segmentation. We solve the problem using the Chambolle Pock algorithm and introduce a linear version to apply suitable LP solvers.
